

Rain is not always reliable. It happens when and for however long it wants. Sometimes too much or too little, and a lot of times directly after hot and sunny days. A automated irrigation system delivers water to the plants when they need it, and in the correct amounts. The irrigation happens during the night – gently and quietly.

And with the help of an automated drip irrigation system you can also irrigate your flower beds, shrubs and hedges while saving water and energy.

Contact us for any questions regarding our services or for an obligation free offer. We guarantee our clients a professional and high-quality design and installation of lawn areas, including turf laying, lawn care and the installation of automated irrigation systems.

DESIGN OF LAWN AREAS  
INSTALLATION AND  
LAYING OF TURF  
CARE OF LAWN AREAS

COMPLETE IRRIGATION  
SYSTEMS

## Complete design and professional care of lawn areas:

➤ **Design & installation of rootzone materials and drainage systems:** The subbase and rootzone materials are most important! No grasses want to grow and establish on heavy, rocky and impervious soils. The success for a functioning and weedfree lawn area is always based on a correct, well installed and well draining subbase and rootzone.

➤ **Design and installation of automatic irrigation systems:** Only in combination with a automated irrigation system will grasses be able to grow and succeed in the long-term with ever changing climate patterns. Modern technologies, such as weather stations and wireless rain sensors that also measure the evapotranspiration rate can help to reduce the usage of water, and allow an economical and sustainable lawncare.

➤ **Drip irrigation systems for flowers, hedges and shrub areas:** These systems help to save water and time, and the plants will always be supplied with the correct amount of water.

➤ **Selection of seed material:**

Native grasses are better adapted to our climate and more resistant towards stress and environmental influences. Custom made seed mixes help to address site-specific needs, such as full sun or shaded areas, and in the establishment of a healthy and dense sward cover.

➤ **Laying of turf and establishment of grasses:**

It is very important to maintain turf in the first weeks after laying it in the most professional way to ensure the grasses grow into the existing rootzone material and increase their hardiness against stresses.

➤ **Regular lawn care (verticut, aerate, fertilize, topdress, overseed,...):**

Only with a professional, well timed and high quality maintenance schedule will it be possible to permanently guarantee beautiful, weedfree and resistant lawn areas.
